To All those who await the Rise of Africa

GREETINGS!

I have been inspired to contact you because you are a major voice of reason. The result of the plans and adjustments that Africa makes will determine if the continent will be relatively free and in the lead or predominately overwhelmed and captured by all the aggressive nations of the world.

Let me tell you right here that I am not contacting you to praise or flatter you, although you are certainly due. However, I wish to offer you another perspective to add to your arsenal of strategies that may prove useful in the plight of influence and persuasion.

As you already know very well, ***mass industrialization will be a game changer for the African continent***. Not any particular country, but all of Africa. It will ***not*** solve all of Africa's problems, but it will certainly make many issues a lot more manageable. This is especially true if several of the industries are successful and profitable. However, we must be honest and recognize that any industry that is begun IN AFRICA *must be non-threatening to Western interests* in order to have a fair chance of getting off the ground.

Additionally, the projects that are undertaken must be within Africa's core competency and relatively easy to finance while producing robust results.

FULL DISCLOSURE: I am an American transplant pro-African. My training and philosophy is admittedly and obviously skewed. As a retired engineer I still maintain the engineering perspective that I can accomplish anything. From what I have seen from my African brothers, sisters and cousins during my short time on the continent; great things are possible here also.

However, Africa [in general] needs projects that are easy to get into that reveal quick and measurable results at the beginning of the industrial cycle. I also get the impression that most Africans know how to farm on some level. Americans grow grass in their front and back yards, while many Africans grow maze, beans, Chinese cabbage and mchiche. Africa is also credited with having 64% of all the untouched arable land in the world. With all the produce that is grown in Africa, it may be accurate to call Africa and agrarian continent.

So, with that said, an ideal industry might be agriculturally based. A perfect plant that fits Africa's need to grow into industry is HEMP! I believe a perfect set of industries could easily be born from the HEMP plant. Now, if you have followed me so far, allow me to further establish my premise. I am proposing that ALL of AFRICA start cultivating HEMP and processing it for any number of the 25,000+ products it is capable of producing. ***I am not particularly focusing on HEMP's distant cousin Marijuana, although it too has some incredibly powerful medicinal properties.*** I am pointing to varieties of the plant that led us into the development of modern civilization over the past 5000 years that was used for all sorts of purposes until the oil barrens altered our perspective in order to create a petroleum dominated world.

That is part of the beauty of the plant. It can replace the toxic chemically based compounds that have begun to pollute and destroy the Earth. The results of its products are biodegradable, sustainable and renewable. Everywhere the plant is sewn the soil is cleaned and improved. It even rejects the growth of weeds to a great extent. It can produce a diverse array of products from food, milk, cooking oil and medicine to cement, plastic, fuel and batteries. You can eat it, wear it and live in it.

To All those who await the Rise of Africa

It solves the three (3) primary needs for survival by providing food, clothing and shelter. It has the potential to support the communities that produce it and create intra-continental trade. Among its many other attributes, HEMP can replace many imports with improved domestic alternatives. With all of these other potential properties it has the potential to create hundreds of new industries, thousands of new businesses and maybe millions of careers. In this crazy, upside-down world we honor this potential by banning it throughout much of the world. Yet, South Africa understands the potential and can provide a great deal of technical support to the continent through its ***Cheeba Africa Cannabis Academy***.

There is monumental potential in this super plant that straddles renewable agriculture with the provision of necessities and high technology in a planet friendly ecologically-sound manner all at the same time, meanwhile cleaning up the errors of past chemical exploits.

I am hoping that you can see the potential and beauty of this plant and its benefits as I do and become willing to include it in some of your discussions as a possible means to THE END. To that end, I have added a few links of information that can assist you with your enthusiasm. I hope this is helpful in the preservation and redevelopment of the African continent. My ultimate aim is to see Africa take its rightful place in front. I do not represent or promote any company, financial interest or entity seeking to benefit from this. I simply would like Africa proper to emerge as the great land of the original people and cultures once again.

Kindest regards,

Isaac Richardson
